PROGCON - CHAPTER 2

CLASS NUMBER: 03

SECTION: AC 192

NAME: Plaine Beatriz G. Bona

DATE: 11/08/19

PART 1: Identify the following.

Data Type 1. A classification that describes what values can be assigned, how the variable is stored, and what types of operations can be performed with the variable.

Hierarchy Chart 2 A diagram that illustrates modules' relationships to each other.

Data Dictionary 3 A list of every variable name used in a program, along with its type, size, and description.

Functional Conceion A A measure of the degree to which all the module statements contribute to the same task.

Prompt 5 A message that is displayed on a monitor to ask the user for a response and perhaps explain

how that response should be formatted.

6 A module that can more easily be reused in multiple programs.

Hooting-Point 7. A number with decimal places.
Repregram component's name.

Numeric Constant 9 A specific numeric value.

Declaration 10. A statement that provides a data type and an identifier for a variable.

Hungarian Notation part of its name.

Integer 12. A whole number.

Assignment

Keywords

Module Body

Binary Operator 13. An operator that requires two operands—one on each side.

Mogic Number 14 An unnamed constant whose purpose is not immediately apparent.

ment 15 Assigns a value from the right of an assignment operator to the variable or constant on the left of the assignment operator.

Alphanumeric Values 16 Can contain alphabetic characters, numbers, and punctuation.

17 Constitute the limited word set that is reserved in a language.

18 Contains all the statements in the module.

Annotation

19. Contains information that expands on what appears in another flowchart symbol; it is most often represented by a three-sided box that is connected to the step it references by a dashed lipe.

Self-documentingho. Contains meaningful data and module names that describe the program's purpose.

right-associatingtyand

Right-to-left Accountivity (1) Describe operators that evaluate the expression to the right first.

Numeric 22. Describes data that consists of numbers.

Left-torigh nucciativity 23. Describes operators that evaluate the expression to the left first.

Overhead 24. Describes the extra resources a task requires.

Oraer of Operations 25. Describes the rules of precedence.

In Scope 26. Describes the state of data that is visible.

60rbage 27. Describes the unknown value stored in an unassigned variable.

Local 28. Describes variables that are declared within the module that uses them.

610601 29 Describes variables that are known to an entire program.

Rules of Precedence 30. Dictate the order in which operations in the same statement are carried out.

External Documentation that is outside a coded program.

tation
Internal Decumentation 32. Documentation within a coded program.

Real Numbers 33. Floating-point numbers.

Fnd-of-job Tasks 34. Hold the steps you take at the end of the program to finish the application.

House Heeping Tasks 35. Include steps you must perform at the beginning of a program to get ready for the rest of the program

Detail loop Tauce 36. Include the steps that are repeated for each set of input data.

Module Header 37 Includes the module identifier and possibly other necessary identifying information.

Lower (amel casing 38 is another name for the camel casing naming convention.

Kebab case 39 Is sometimes used as the name for the style that uses dashes to separate parts of a name.

Module Return Statement 40 Marks the end of the module and identifies the point at which control returns to the program or module that called the module.

41. One that can hold digits, have mathematical operations performed on it, and usually can hold a decimal point and a sign indicating positive or negative.

Main Program

42. Runs from start to stop and calls other modules.

Nomed conctant

43. Similar to a variable, except that its value cannot change after the first assignment.

44 Small program units that you can use together to make a program; programmers also refer to modules as subroutines, procedures, functions, or methods.

Initializing A variable 45. The act of assigning its first value, often at the same time the variable is created.

Encapsulation 46. The act of containing a task's instructions in a module.

Functional Decomposition 47 The aet of reducing a large program into more manageable modules.

48. The act of repeating input back to a user either in a subsequent prompt or in output.

49. The equal sign; it is used to assign a value to the variable or constant on its left.

50. The feature of modular programs that allows individual modules to be used in a variety of applications.

Numeric Variable

Modules

Echoing Input

Reusability

Assignment operator

- Reliability 51. The feature of modular programs that assures you a module has been tested and proven to function correctly.
- Camel Casing 52 The format for naming variables in which the initial letter is lowercase, multiple-word variable names are run together, and each new word within the variable name begins with an uppercase letter.
- Pascal Casing

 53. The format for naming variables in which the initial letter is uppercase, multiple-word variable names are run together, and each new word within the variable name begins with an uppercase letter.
- Mainline Logic

 Sa. The logic that appears in a program's main module; it calls other modules.

 St. The logic that appears in a program's main module; it calls other modules.

 St. The memory address identifier to the left of an assignment operator.

58 To use the module's name to invoke it, causing it to execute.

- Modularization 56. The process of breaking down a program into modules.

 Abstraction 57. The process of paying attention to important properties while ignoring nonessential details.
- Program Comments 60. Written explanations that are not part of the program logic but that serve as documentation for those reading the program.

Choose from the following

Call the module

| 1. | Abstraction / | 22. Hierarchy chart | 43. Modules / |
|---------|--|--|-------------------------------|
| 2. | Alphanumeric values / | 23. Housekeeping tasks — | 44. Named constant / |
| 3. | Annotation symbol | 24. Hungarian notation / | 45. Numeric / |
| 4. | Assignment operator — | 25. Identifier / | 46. Numeric constant (literal |
| 5. | Assignment statement / | 26. In scope / | numeric constant) |
| 6. | Binary operator < | 27. Initializing the variable | 47. Numeric variable / |
| 7. | Call a module — | 28. Integer | 48. Order of operations |
| 8. | Camel casing ~ | 29. Internal documentation - | 49. Overhead — |
| 9. | Data dictionary / | 30. Kebob case | 50. Pascal casing — |
| 10. | Data type | 31. Keywords | 51. Portable / |
| | Declaration | 32. Left-to-right associativity / | 52. Program comments |
| 12. | Detail loop tasks / | 33. Local / | 53. Program level / |
| 13. | Echoing input — | 34. Lower camel casing / | 54. Prompt - |
| 14. | Encapsulation / | 35. Lvalue / | 55. Real numbers — |
| 15. | End-of-job tasks / | 36. Magic number / | 56. Reliability / |
| | External documentation / | 37. Main program — | 57. Reusability — |
| 17. | Floating-point / | 38. Mainline logic / | 58. Right-associativity and |
| 18. | Functional cohesion / | 39. Modularization | right-to-left associativity |
| 19. | Functional decomposition / | 40. Module body | 59. Rules of precedence |
| | Garbage ~ | 41. Module header / | 60. Self-documenting |
| energy. | Total II | ************************************** | |
